Project Design Phase

Import Set Table & Transform Map Architecture

ServiceNow Data Import Process & Implementation Overview:

The data import process in ServiceNow provides a structured mechanism to fetch external data, stage it into intermediate tables, and map it into target instance tables. Key components and execution steps include:

- **Phase 3: Import Set Table Setup** – Navigate to Application Navigator → Load Data. Click on Load Data and create an import table by setting the Label to 'Employee Import' (auto-populating Name as 'u_employee_import'). Choose the spreadsheet source file and click Submit.
- **Staging & Validation** – Upon clicking Submit, verify successful processing and staging of records. Ensure the system displays completion status with zero errors before proceeding to transformation.
- **Phase 4: Create Transform Map** – Click on the 'Create Transform Map' link from the success banner. Provide the Name as 'Sample Spreadsheet Import' with the Source Table set to 'Employee Import'.
- **Target Mapping & Execution** – Map source fields to target table attributes, establish field relationships, and run the transform script to populate production tables seamlessly.
